REGISTERED OFFICE: 1st Floor, Stanmore House, 15/19 Church Road, Stanmore, Middlesex, HA7 4AR
Company Registration # 5865842

Background: Cyrania Z is an unbroken three year old having been at the current yard for approximately 6 months. There is no record of Equine Influenza or Equine Herpes Virus vaccine status.

No previous lameness was declared by the current owner. It was declared the filly had received no medication during his time with the current owner. No surgery/vices were noted or declared.

Conformation: Cyrania Z stood at approximately 16.1hh. The filly was in good condition, walked well with a mild toe in conformation and was slightly off set through the knees.

General Physical Examination:

1. Auscultation of the heart, chest and abdomen were unremarkable.
2. There was mild distension of both fore coffin joints. There was no heat on palpation and the joints handled well on passive flexion.
3. Both fore fetlocks carried some mild distension. There was no heat on palpation and the joints handled well on passive flexion.
4. There was mild digital tendon sheath effusion in both hinds. Both carried no heat and were not painful on passive flexion.
5. The knee and stifle joints didn't have any significant distension and handled well on passive flexion .
6. The flexor tendons and suspensory ligaments were tight and cold and handled well on palpation.
7. Palpation of the back showed no resentment from wither to sacrum. The filly showed good range of motion through its back.
8. The range of flexion and mobility of the neck was within normal limits.
9. The right fore foot was upright and boxy.
10. The filly was bare footed.
11. A full oral examination was not performed.
12. During all stages of the examination the filly displayed a good temperament .

Locomotor Examination :

- The filly trotted sound in hand and in a straight line on a firm and level surface.
- The filly was examined on a lunge on hard and soft surfaces. She was also examined at the walk and trot in a fibre sand arena where she displayed a fluent action.

- Flexion tests were within normal limits.
- Post exercise examination was unremarkable.

Radiography:

The following significant changes were noted ;

- Mild changes to the lower hock joints on both sides
- OCD fragment in right hock (lateral trochlear ridge)
- Plantar fragment proximal P1 in right hind fetlock

Overall the radiographs were deemed to be **low to medium** risk for a filly of this age and its intended purpose.

Laboratory Analysis:

A blood sample for prohibited substances was taken and sent for secure storage.

Summary

In my opinion the filly represents a suitable prospect for showjumping purposes however the radiographic changes evident in the right hock and right hind fetlock will likely bring further comment with regard to future resale. The filly is a sound individual but should 'clean radiographs' be desired for a future sale surgery may be required.

Name Dr. Gareth Ryan
