General evaluation

After close observation and analysis; taking all previous and existing factors into consideration, the horse qualifies for the approved use and sport he is currently undergoing.

During examination, the horse demonstrated good movements and an excellent character. The clinical, medical and orthopedic examinations were more than satisfactory to prove his good state of health.

X-ray exams are generally good; but it should be noted that, the moderate bone remodeling of the proximal interphalangeal joint in the RH, in which the horse did not show signs of discomfort or pain during examination, may require treatment and corrective shoes in future instances. The flattened contour of the medial ridge of the talus in the RF had no clinical significance.

1 of April of 2021.
