Motif

X RAY interpretation

Commémoratifs

Those x ray views were taken by Dr Geoffrey DHUGLEVILLE on the 22/03/24.

Description

X-RAYS

Left forelimb

Foot (DP, LM) : Slight sclerosis of the distal edge of the navicular bone, slight ossification of the intern plamar processus

Fetlock (LM) : slight bone remodelling on the distal sesamoid bone

Right forelimb

Foot (DP, LM) : Discreet irregularity of the distal edge of the navicular bone, slight sclerosis of the distal edge of the navicular bone

Fetlock (LM) : slight bone remodeling on the distal sesmoide bone

Left hind limb

Fetlock (LM) : No abnormal findings

Hock (LM) : No abnormal findings

Stifle (LM) : No abnormal findings

Right hind limb

Fetlock (LM, DP) : slight dorsal remodelling of the proximal joint of the feet, a small area seems to be heterogeneous on the LM view and can't be found on the DP view so it coul't be an artefact.

Hock (LM) : Bone irregularity of the tibial cochlea, sclerosis of the third tarsal

Stifle (LM) : No abnormal findings

Conclusions

Considering the view, the sport prognosis seems to be acceptable.
