Shoeing		Previous injections/infiltrations	
Type and date 30 days ago			

The owner / manager declares certain answers given in the "Background Information"

- Authorize horse sedation if necessary
- Authorize removal of horseshoes if necessary
- Authorize lounging in hard surface
- Authorize flexion tests
- Authorize blood sample collection for antidoping test

2.1 Basic radiographic projections

For the evaluation of the findings, these are divided into 4 classes:

Class I:

No specific abnormal findings and findings that are categorized as anatomical variants. (Condition / ideal state).

Class II:

Findings that differ little from ideal condition in which the onset of clinical signs is estimated with a low probability (condition / normal).

Class III:

Findings that differ from the normal condition in which the onset of clinical signs is estimated with a medium probability (condition / acceptable state).

Class IV:

Findings that differ considerably from normal condition in which clinical signs are likely, above 50%. (Condition / risk status).

Intermediate classes:

The use of intermediate classes I - II, II - III and III - IV states that several examiners may reach different results possibly by the clarity of the findings and experiences.

The customer is aware of the disadvantages of image quality when the horseshoes are not removed.

Permission to remove the shoes No Yes

3.1 Results other tests

Not requested

3.2 Recommended test

Based on the findings and then discussed between veterinary and requestor, this:

- renounces perform additional tests
 request perform the following additional tests

CONCLUSIONS

In my opinion, on the balance of probabilities, the conditions reported above today,

- DO NOT DO

Prejudice this horse's suitability for purchase to be used for; obviously an individual prognosis is not possible to give.

In the case of potential risk, this would be considered LOW / MEDIUM / HIGH for a purchase decision.
